

Python 3 Quickstart

Independent study sheet • Not official DPS Agra material • No personal information required

1. Working with values

```
name = input("Name: ")
age = int(input("Age: "))
print(f"Hi {name}; next year: {age + 1}")
```

input() gives text. Convert to int or float before arithmetic. Variables refer to values.

2. Control flow

```
if age >= 14:
    print("Eligible")
else:
    print("Try again later")
for number in range(3):
    print(number)
```

if branches and for repeats. Whitespace controls the program's structure.

3. Lists and functions

```
scores = [72, 88, 95]
def mean(values):
    return sum(values) / len(values)
print(mean(scores))
```

Use small functions and give lists meaningful names.

TRY IT YOURSELF

1. Predict: list(range(4))
2. Write a function is_even(n) returning a boolean.
3. Read five marks and print the largest.

Open the portal Practice IDE for Python, SQL, Web and Block coding.

For other languages, use an approved isolated compiler. Verify unfamiliar code before running.
