

SQL with SQLite

Independent study sheet • Not official DPS Agra material • No personal information required

1. Tables and values

```
CREATE TABLE scores(name TEXT, marks INTEGER);  
INSERT INTO scores VALUES ('Mira', 91);  
INSERT INTO scores VALUES ('Aman', 77);
```

Use toy databases; never experiment on live school records.

2. Filters and ordering

```
SELECT name, marks  
FROM scores  
WHERE marks >= 80  
ORDER BY marks DESC;
```

WHERE filters each row; ORDER BY controls the presentation order.

3. Aggregates

```
SELECT COUNT(*) AS students,  
       AVG(marks) AS average  
FROM scores;
```

COUNT counts rows; AVG computes a numerical average.

TRY IT YOURSELF

1. Select names alphabetically.
2. Find all scores between 70 and 90.
3. Create a table and calculate its average.

Open the portal Practice IDE for Python, SQL, Web and Block coding.

For other languages, use an approved isolated compiler. Verify unfamiliar code before running.
